

Executive Scan Review Report

1. Legacy Data Hygiene & Baseline State

- **Initial Discovery:** An audit of the baseline configuration shown in Viz1_Raw files access.png revealed high taxonomy fragmentation across the Assembly's storage infrastructure, including multiple unclassified or vaguely categorized repositories.

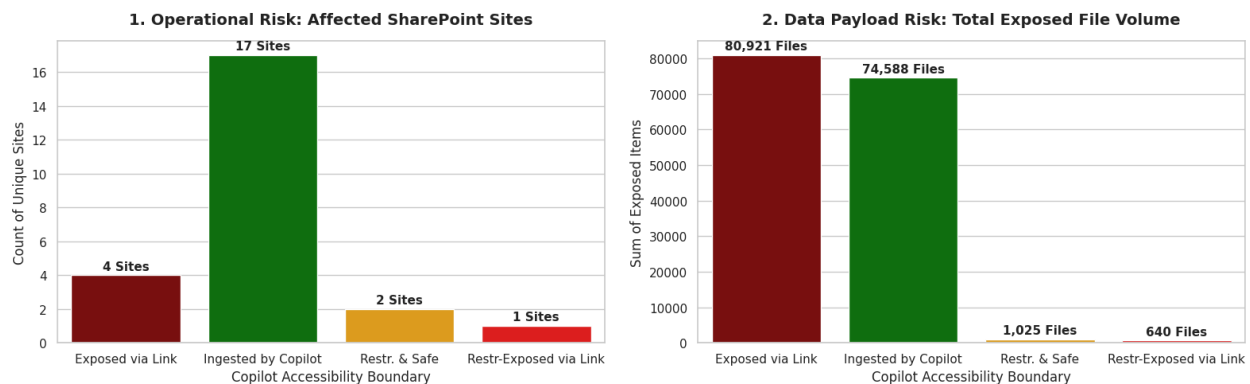

- **Data Cleaning Phase:** Programmatic remediation standardized structural metadata and department strings as shown in Viz2_Post cleanup files access.png. While data classification remained unchanged during this initial pass, it successfully isolated structural data corruption to prepare for policy mapping.

2. Pre-Mitigation Threat Landscape (The Blast Radius)

As documented in `Viz3\_Current label\_affected sites and files payload.png`, running Microsoft 365 Copilot against the unmitigated infrastructure creates a critical data leakage vector:

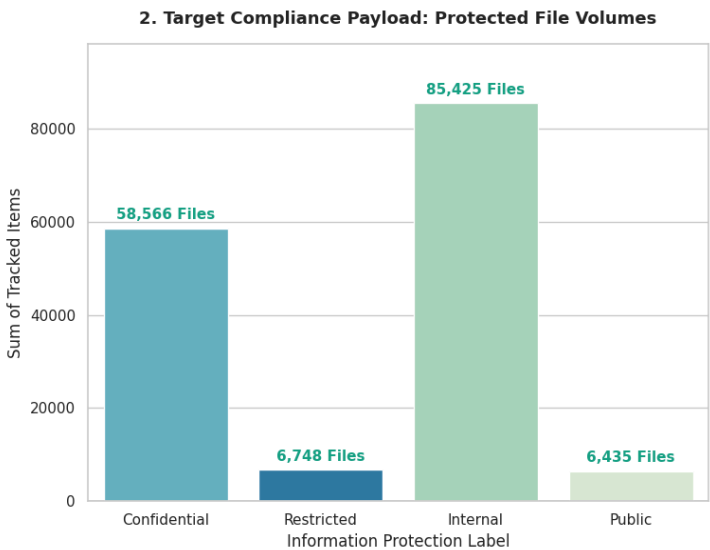

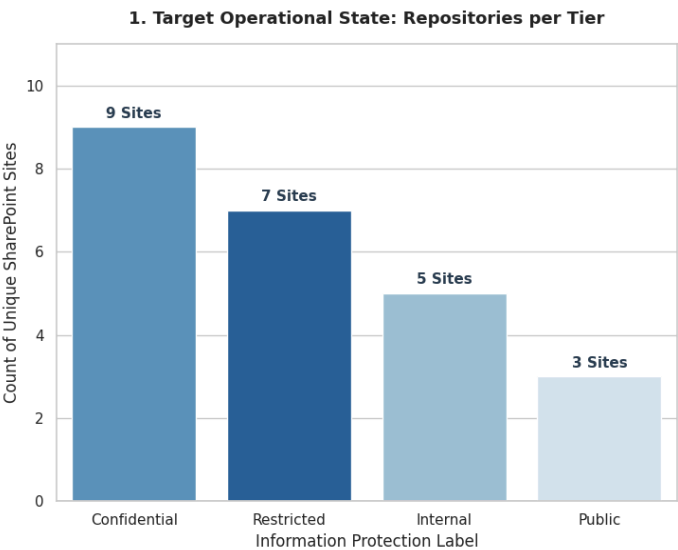

- **Operational Exposure:** 4 high-risk sites are actively exposing data via anonymous public links, and 1 Restricted site is fully leaked via active sharing permissions.
- **Payload Severity:** This vulnerability exposes a catastrophic total of 80,921 unmanaged files to the global indexing scope, making highly sensitive credentials and PII completely searchable across the organization.

3. Post-Mitigation Compliance Target State

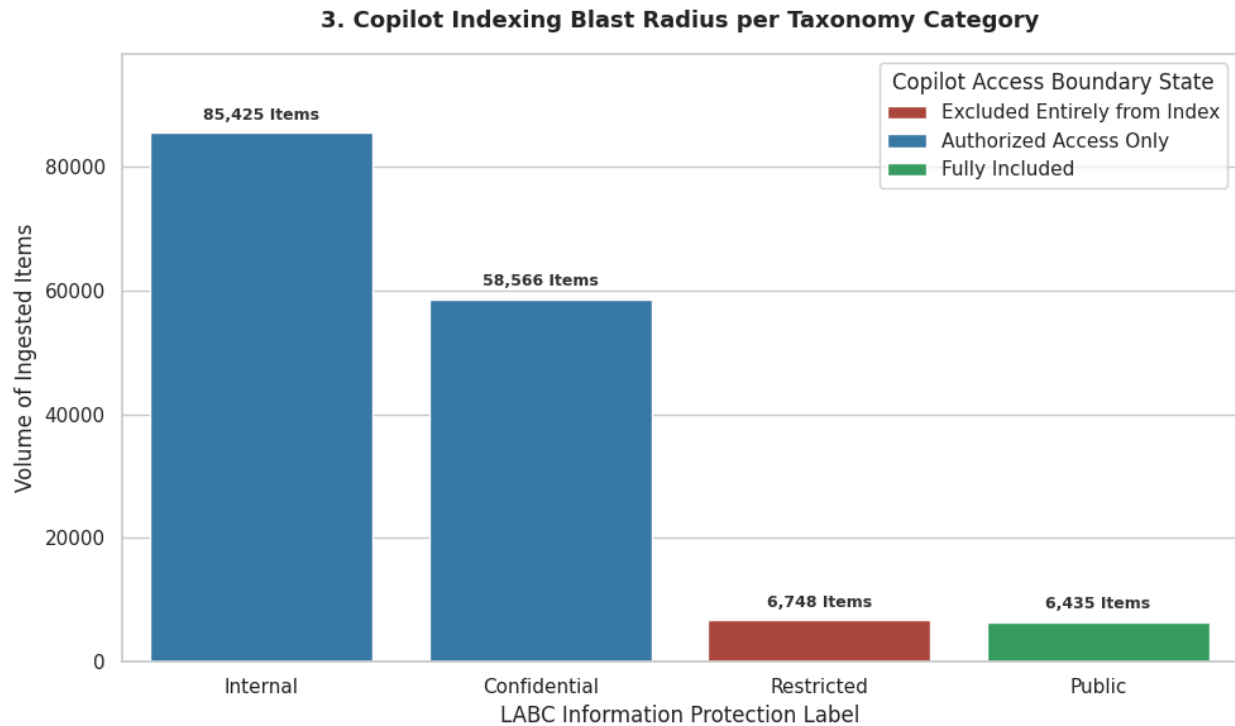

By programmatically implementing the four-tier framework from ``INFORMATION_PROTECTION.pptx`` via ``bcleg_src.py``, the repository footprint shifts to a strictly controlled architecture as mapped out in ``Viz4_Updated label_affected sites and files payload.png``:

Sensitivity Tier	Protected Repositories	Protected Document Volume	Access Boundary Strategy
Confidential	9 Sites	58,566 Files	Inherited sensitivity tags; responses track ACL permissions.
Restricted	7 Sites	6,748 Files	Complete exclusion from indexing; Zero LLM ingestion.
Internal	5 Sites	85,425 Files	Mandatory anonymous link revocation; restricted to internal staff.
Public	3 Sites	6,435 Files	Open ingestion; authorized for general AI availability.

4. Final Copilot Boundary Enforcement

The final verification layer illustrated in `Viz5\_Updated\_Copilot access files payload.png` confirms full security perimeter enforcement prior to go-live:

- **Total Isolation:** 6,748 ultra-sensitive files (Restricted records) are programmatically Excluded Entirely from the Index.
- **Access Control Containment:** 143,991 items spanning Internal and Confidential tiers have their network boundaries locked down under strict "Authorized Access Only" parameters, completely mitigating unauthorized semantic indexing.
- **Public Access records** are available for copilot access.
